

Getting Bigger

Purpose

To review more advanced aspects of user interfaces and event handlers

Directions

Create an interface for a program that looks like the one in the first image below. Then add an event handler to the JSlider that changes the font size of the text in the JTextArea according to the value on the slider, as illustrated in the second image.

Note: These directions are intentionally vague. Use the internet and whatever other resources you have available to try to piece together how to do this. Be sure to site any sources you use as comments in your code.
